Contents

Part 1 Key drivers for waste management and co-product recovery in food processing

- Waste minimisation, management and co-product recovery in food processing: an introduction
- Consumer interests in food processing waste management and co-product recovery

Part 2 Optimising manufacturing to minimise waste in food processing

- Chain management issues and good housekeeping procedures to minimise food processing waste
- Process optimisation to minimise energy and water use in food processing

Part 3 Key issues and technologies for food waste separation and co-product recovery

- The importance of microbiological risk management in the stabilization of food processing co-products
- Effects of post harvest changes in quality on the stability of plant co-products
- The potential for de-structuring of food processing waste by combination processing
- Enzymatic extraction and fermentation for the recovery of food processing products
- Supercritical fluid extraction and other technologies for extraction of high value food processing co-products
- Membrane and filtration technologies and the separation and recovery of food processing waste
- Separation technologies for food wastewater treatment and product recovery

Part 4 Waste management in particular food industry sectors and recovery of specific co-products

- Waste management and co-product recovery in red and white meat, dairy and fish processing
- Recovery and reuse of trimmings and pulps from fruit and vegetable processing
- High-value co-products from plant foods
- Natural dyes from food processing wastes
- Improving waste management and co-product recovery in vegetable oil

Part 5 Minimising disposal: wastewater and solid waste management in the food industry

- Treatment of food processing wastewater
- Dewatering systems for solid food processing waste
- Fermentation, biogas and biohydrogen production from solid food processing
